

GOWTHAM MUDDUSETTY

Backend Developer | Golang · Microservices · Kubernetes · Distributed Systems

+91-7981230066 | gowtham171143@gmail.com | [linkedin.com/in/gowtham-muddusetty](https://www.linkedin.com/in/gowtham-muddusetty) | github.com/GowthamMuddusetty

PROFESSIONAL SUMMARY

Backend Developer with 2+ years of experience designing, building, and shipping scalable Golang microservices across real-time gaming and enterprise SaaS domains. Skilled in event-driven architecture, gRPC/REST API design, and cloud-native deployment with Kubernetes, Docker, and GCP. Proven track record of delivering high-throughput, low-latency systems — including real-time platforms handling 10K+ events/sec at sub-100ms latency — with strong observability, clean architecture, and multi-tenant security. Experienced across the full backend lifecycle, from schema design and API development to containerized production deployment and distributed tracing.

TECHNICAL SKILLS

Languages	Golang, Java, Python, Bash
Frameworks	Gin, gRPC, Protocol Buffers, Spring Boot 2.7, React.js
Databases	PostgreSQL, CockroachDB, MongoDB, MySQL, Redis
Messaging	Apache Kafka, Event-Driven Architecture
Protocols	REST, gRPC, QUIC, UDP, WebSocket
Cloud & DevOps	Docker, Kubernetes (GKE), Helm, CI/CD, GCP, Linux, Git
Observability	OpenTelemetry, Datadog, Distributed Tracing, Metrics, Logging
Other	Blockchain integration, Multi-tenant SaaS, RBAC, JWT Auth

WORK EXPERIENCE

Backend Developer | LCS Prime, Hyderabad, India

Mar 2025 – Present

EVMS — Enterprise Vendor Management System

Golang · PostgreSQL · Kafka · JWT · Docker · Kubernetes · GCP · OpenTelemetry

Multi-tenant SaaS platform managing org onboarding, RBAC, recruiter groups, candidate job pipelines, and performance metrics for consulting firms.

- Architected a modular Golang backend across **Admin, Identity, Consulting, Files, Metrics, and Audit** domains with clean separation of concerns, designed to scale into independent microservices.
- Built a multi-realm **JWT authentication** system with isolated login portals (Admin / Consulting / Candidate) and strict RBAC, achieving **zero cross-portal token reuse** across 30+ tenant organizations.
- Engineered org registration workflows including OTP email verification, admin approval queues, and invitation-token-based onboarding.
- Developed recruiter and candidate group management with bulk assignments, ownership-transfer flows, and a **7-stage job pipeline** (Submitted → Interview → Offer → Closed) supporting 500+ active candidates.
- Designed a multi-schema **PostgreSQL** database (core / identity / consulting / files / metrics) with row-level org_id tenant isolation and immutable audit logs written atomically per transaction.
- Built a metrics engine producing daily, weekly, and monthly recruiter rollups — submission counts, offer conversion rates, and ranked leaderboards.
- Deployed on **Kubernetes (GKE)** with Helm and integrated **OpenTelemetry** tracing and Datadog dashboards, reducing mean time to detect (MTTD).

Backend Developer | Gods and Heroes Studio, Hyderabad, India

Feb 2024 – Feb 2025

Gods of Cricket (GOC) — Real-Time 11v11 Multiplayer Cricket Game

Golang · Gin · gRPC · Protobuf · QUIC · UDP · Kafka · CockroachDB · MongoDB · Redis · Blockchain · Docker · Kubernetes

AAA-level online multiplayer cricket simulation featuring real-time 11v11 matches, career mode, and blockchain-backed digital asset ownership across PC, Android, and iOS.

- Designed scalable Golang microservices using **Gin** for real-time match state, player actions, and game-event processing with **sub-100ms latency** under peak load.
- Built real-time game APIs with **gRPC, Protocol Buffers, QUIC, and UDP**, enabling high-throughput, low-latency communication across **22 concurrent players** per match and 1,000+ simultaneous matches.
- Integrated **Blockchain** for secure in-game transactions and tamper-proof digital asset ownership tracking across player inventories.
- Designed a **Kafka** event pipeline processing **10K+ match events/sec** (deliveries, wickets, score updates) asynchronously without impacting live gameplay.
- Optimized the data layer: **CockroachDB** for distributed SQL match records, **MongoDB** for flexible game metadata, and **Redis** for session caching and real-time leaderboards.
- Containerized and deployed all services on Kubernetes with Docker; monitored production health using Datadog distributed tracing

Graduate Trainee (Internship) | Feuji Software Solutions, Hyderabad, India

Feb 2023 – Sep 2023

Property Investment Platform

Java · Spring Boot 2.7 · Spring JPA · React.js · MySQL · Maven · REST APIs

Commercial real estate platform connecting property owners, builders, and investors with tools for discovery, investment tracking, and market-based recommendations.

- Designed and developed backend **REST APIs** with **Spring Boot 2.7** and Spring JPA to manage property listings, user accounts, and investment transaction data across 20+ endpoints.
- Built a responsive **React.js** frontend with intuitive search, filtering, and property management interfaces for both sellers and buyers.
- Integrated **MySQL** with optimized relational schemas and indexing, improving query performance for property.
- Implemented **JWT-based authentication** and role-based authorization to secure user accounts and protect sensitive financial data.
- Automated builds and dependency management with **Maven**, ensuring consistent and reproducible deployment pipelines.

EDUCATION

B.Sc. Computer Science | SDHR Degree College, Tirupati

2018 – 2021

CERTIFICATIONS

Java Full Stack Development — Internship Certification | Feuji Software Solutions

Hands-on full-stack training covering Spring Boot, REST APIs, React.js, and MySQL through real-world project delivery.
